

COMET-latency trade-off on unseen FLEURS 500 (same translator, gtx; T = 4/6/8/12 per curve)

Upper-left is better. LAAL is forced-aligned (Qwen3-ForcedAligner; wav2vec2 CTC agrees within 22 ms).
Axes are zoomed to the policies whose latency bands overlap; y is broken (⋯) for the floor. Off-scale values are listed per panel.
COMET uses one multilingual encoder, so panels are far more comparable than under BLEU — but it stays reference-based.

- Multi-agent loop (ours)
- ...same boundaries, no ranking
- Causal align (TransLLaMa)
- AlignAtt (Papi 2023)
- Syntactic chunks (SASST-style)
- Mechanical 8-char (floor)
