

BLEU-latency trade-off on unseen FLEURS 500 (same translator, gtx; T = 4/6/8/12 per curve)

Upper-left is better. LAAL is forced-aligned (Qwen3-ForcedAligner; wav2vec2 CTC agrees within 22 ms). Empty x ranges are compressed (break marks on the axis).

Punctuation has no latency knob (it segments below the T budget), so it is one point; it and prefix-match MU sit in a slower band — shown, not matched.

BLEU is NOT comparable across panels (de 13a, ja ja-mecab).

- Full-sentence offline (ceiling)
- Multi-agent loop (ours)
- Causal align (TransLLaMa)
- AlignAtt (Papi 2023)
- Syntactic chunks (SASST-style)
- Prefix-match MU (Zhang 2020)
- Punctuation (no latency knob)
